

## Superheated steam flow measurement

Permanently installed non-invasive ultrasonic measuring system

### Features

- Exact and highly reliable measurement of superheated steam up to 630 °C
- Installation and start-up do not require any pipe work nor any process interruptions
- Volumetric and mass flow rate available without additional steam calculator
- Non-invasive and wear-free measurement without pressure loss
- Maintenance-free acoustic coupling using permanent coupling foil
- Bidirectional measurement over a wide turndown ratio - up to 10:1
- Advanced self-diagnosis and possibilities for event-based triggering of data recording
- Bidirectional communication and support of common bus technologies
- Transmitter and transducers are separately calibrated (traceable to national standards)
- The measurement is drift free

### Applications

- Process control
- Consumption metering
- Check metering

## Function

### Measurement principle

The flow velocity of the fluid is measured using the correlation principle. 2 pairs of ultrasonic transducers are mounted one after the other at a distance  $\Delta x$  on the pipe. The transducer pairs form the measuring barriers A and B. Ultrasonic signals are alternately emitted by the emitters  $A_1$  and  $B_1$  and received by the respective receivers  $A_2$  and  $B_2$ . The ultrasonic signals are modulated regarding amplitude and phase by the swirls of the turbulent flowing fluid. Since the swirls move with the flow, they pass the measuring barriers A und B with a time offset  $\Delta t$ , so that the modulation patterns of the ultrasonic signals of measuring barrier A and B are also offset by  $\Delta t$ . This time offset  $\Delta t$  is measured by means of cross correlation of the modulation signals.

### Calculation of volumetric flow rate

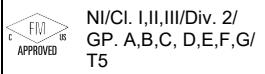

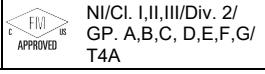

$$\dot{V} = A \cdot v = A \cdot k_{Re} \cdot \frac{\Delta x}{\Delta t}$$

where

- $\dot{V}$  - operating volumetric flow rate
- A - cross-sectional pipe area
- v - flow velocity
- $k_{Re}$  - fluid mechanics calibration factor
- $\Delta x$  - distance between measuring barriers
- $\Delta t$  - time offset of the modulation patterns
